

# **!TURN OFF THE POWER!**

When replacing bulbs be sure to shut the power off, either by turning off the light switch, unplugging the attached harness, or by removing the interior lighting fuse. Leaving power turned on can cause an electrical arc when installing new bulbs, blowing a fuse or worse. Save yourself any possible headaches and turn off the power! Note that some sockets are polarized. If a bulb does not light up, turn the bulb around and try it again.
